Unified Omnichannel Customer Experience Platform

1. Problem Context

Background

Customers interact with businesses through multiple channels such as voice calls, WhatsApp, email, web chat, and social platforms. From the customer's perspective, these are simply different ways to reach the same company. Internally, however, most organizations manage each channel using separate tools, workflows, and teams.

This gap between customer expectations and internal operations creates a fragmented experience for both customers and support teams.

Customer Pain Points

From the customer's point of view

- Customers are often required to repeat the same issue when they move between channels.
- Responses vary depending on the agent or channel, which reduces confidence in the company.
- Urgent problems are not always recognized or prioritized correctly.
- Resolution feels slower than expected, even for relatively simple issues.

From the support agent's point of view

- Agents rarely have full visibility into a customer's previous interactions.
- A significant amount of time is spent searching for context instead of solving problems.
- Heavy reliance on scripts and manual steps increases cognitive load.
- Constant pressure to meet SLAs contributes to stress and burnout.

From the CX manager's point of view

- Identifying which conversations need immediate attention is difficult.
- Insights are often available only after issues escalate.

- Support costs increase as volumes grow, without proportional efficiency gains.
-

Why Existing Systems Fall Short

Most customer support platforms:

- Treat each communication channel independently.
- Rely on rule-based automation that struggles in complex or emotional scenarios.
- Provide analytics after interactions are complete rather than during them.
- Fail to connect conversations directly to operational actions such as escalation or follow-ups.

As a result, teams remain reactive and improvements to customer experience are incremental rather than meaningful.

Opportunity

There is an opportunity to treat customer interactions as a continuous conversation rather than isolated tickets. By unifying context across channels and assisting agents in real time, organizations can resolve issues faster, reduce effort, and improve customer trust while keeping human judgment at the centre.

2. Target Users

End Customers

- Want quick resolution without repeating information.
- Expect consistent answers regardless of the channel used.
- Value being understood, especially during stressful situations.

Customer Support Agents

- Need complete customer context in one place.
- Want help prioritizing conversations and deciding next steps.
- Prefer tools that assist their work rather than replace them.

CX and Operations Managers

- Focus on SLA adherence and customer satisfaction.

- Need visibility into trends, bottlenecks, and risk areas.
 - Aim to reduce operational costs without harming experience.
-

3. User Personas and Their Needs

Persona 1: The Customer

Customers approach support with a clear goal: to get their issue resolved quickly and with minimal effort. They expect the company to remember previous interactions, even if they switch channels. When an issue is urgent, they expect faster attention. More than anything, they want responses that reflect an understanding of their specific situation rather than generic replies.

Persona 2: The Support Agent

Agents handle a high volume of conversations every day and are under constant time pressure. They need immediate access to customer history to avoid asking repetitive questions. Clear indicators of urgency and suggested responses help them work faster, but they still want control over the final message and decision-making.

Persona 3: The CX Manager

CX managers are responsible for maintaining service quality at scale. They want early visibility into high-risk conversations, recurring issues, and SLA risks. Their focus is on improving efficiency and customer satisfaction in a measurable way, rather than reacting after problems escalate.

4. Key Features

MVP (Initial Focus)

The MVP is designed to address the most critical pain points while ensuring trust and ease of adoption.

Unified Conversation Timeline

- Displays all customer interactions across channels in a single chronological view.
- Reduces time spent searching for context.

Intent and Sentiment Detection

- Identifies what the customer is trying to do.
- Highlights emotional tone to guide appropriate responses.

Urgency Identification

- Flags conversations that require immediate attention.
- Helps teams prioritize effectively.

Agent Response Suggestions

- Provides draft responses based on context and history.
- Agents retain control over the final response.

Action Recommendations

- Suggests next steps such as escalation or ticket creation.
 - Helps maintain consistent workflows.
-

Future Enhancements

These features would be introduced after accuracy and trust are established.

- Automated handling of low-risk, repetitive issues.
 - Proactive outreach before frustration escalates.
 - Predictive indicators for churn or dissatisfaction.
 - Deeper workflow automation across enterprise tools.
 - Real-time assistance during voice calls.
-

5. Success Metrics

Customer Metrics

- Reduction in average resolution time.
- Increase in first-contact resolution rate.
- Improvement in CSAT or NPS.

Agent Metrics

- Reduction in average handling time.
- Increase in issues resolved per agent.

- Improved agent satisfaction scores.

Business Metrics

- Lower cost per ticket.
 - Improved SLA adherence.
 - Higher customer retention.
-

6. Assumptions and Constraints

Assumptions

- Customers already interact across multiple channels.
- Enterprises have existing CRM and support tools.
- Agents are open to assistance if accuracy is reliable.

Constraints

- Data privacy and security are mandatory.
 - Accuracy is prioritized over full automation.
 - Human oversight is required for sensitive cases.
 - Adoption must be gradual to build trust.
-

7. Product Summary: What We Are Building

This product is a decision-support and context-unification platform for customer experience teams.

It sits between customer communication channels such as voice, WhatsApp, email, chat, and social platforms, and internal systems like CRM, ticketing, and workflows. Its role is to bring all customer interactions into a single view, surface intent and urgency, and guide agents toward the most appropriate next action.

The platform is not designed to replace agents. Instead, it removes friction by eliminating context gaps, reducing prioritization guesswork, and minimizing repetitive manual work. Agents remain responsible for decisions and communication, while the system supports them with timely insights and recommendations.

8. Concrete Examples: How the Platform Works

Example 1: Customer Switching Channels

Situation

- A customer emails about a delayed refund.
- After not receiving a quick response, they message on WhatsApp.

Without the platform

- The WhatsApp agent has no context.
- The customer repeats the issue.
- Frustration increases and resolution slows.

With the platform

- The WhatsApp message is linked to the earlier email.
- The agent sees a single conversation timeline.
- Key context such as refund intent and customer frustration is visible.
- The agent responds with relevant, informed information.

Outcome

- Faster resolution.
 - Reduced customer effort.
 - No repeated explanation.
-

Example 2: Urgent Issue Identification

Situation

- A customer calls a telecom support line after two days of internet outage.

Without the platform

- The issue is treated like a regular ticket.
- It enters the normal queue, risking SLA breach.

With the platform

- The conversation is flagged as high urgency.
- The issue is routed faster.

- The agent prioritizes immediate resolution.

Outcome

- Faster intervention.
 - Reduced escalation.
 - Improved customer trust.
-

9. Platform Walkthrough: How It Looks and Feels

Input Layer

- Customer messages arrive from voice, WhatsApp, email, web chat, and social platforms.
- All channels are normalized into a common format.

Understanding Layer

- Customer intent, sentiment, and urgency are identified.
- Relevant customer history and CRM data are pulled in.

Agent Experience

- Unified conversation timeline.
- Key highlights for intent and urgency.
- Suggested responses and next actions.
- Agent reviews, edits, and sends.

Manager Experience

- Live view of active issues.
- Visibility into high-risk conversations.
- Cross-channel trends and SLA risk indicators.

Interface Feel

- One panel for conversation history.
 - One panel for the active interaction and suggestions.
 - A supporting panel for customer context and priority indicators.
-

Summary

This product improves customer experience by reducing fragmentation and supporting agents with better context and guidance. Rather than replacing human judgment, it focuses on helping teams work more effectively. By prioritizing clarity, trust, and measurable outcomes, the platform delivers value to customers, agents, and businesses.
