Unified Omnichannel Customer Experience Platform

Purpose of This Document

This document presents the wireframes and user journey flows derived from the interactive prototype. The objective is to demonstrate how the platform operationalizes the ideas outlined in the PRD through concrete agent and manager workflows.

The wireframes focus on:

- Unifying customer conversations across channels
- Assisting agents with context, prioritization, and next actions
- Handling escalation and routing in a structured, explainable manner
- Providing managers with visibility into risk and system health

The designs are intentionally low-to-mid fidelity and prioritize workflow clarity and decision support over visual polish.

Platform Overview

The platform supports two primary user roles:

- **Support Agent:** Handles day-to-day customer conversations, responses, and escalations.
- **CX / Operations Manager:** Monitors risk, SLA health, and systemic issues across channels.

Each role is provided with a dedicated dashboard and workflow surfaces tailored to their responsibilities.

Unified Conversation Timeline

The Unified Conversation Timeline is the foundational screen of the platform. It consolidates all customer interactions across voice, email, WhatsApp, chat, and social channels into a single chronological view.

This eliminates context fragmentation and enables agents to immediately understand the customer's history without switching tools or asking repetitive questions.

The main conversation timeline screen

Customer Context and Signals

Alongside the conversation timeline, the platform surfaces a concise customer context panel. This includes customer profile information, recent issues, detected intent, sentiment, and urgency indicators.

These signals are designed to assist agent judgment, not replace it. They provide situational awareness while keeping the agent in full control of decisions.

Escalation and Routing

The Escalation and Routing interface provides a structured way to handle high-urgency or high-risk conversations. Conversations are flagged based on signals such as urgency, repeated contact, or SLA risk.

Each escalation includes an explanation of why it was flagged, allowing agents and supervisors to make informed routing decisions.

Manager View and Risk Monitoring

The Manager Dashboard provides a high-level view of operational health across channels. It highlights high-risk conversations, SLA risks, and emerging trends.

Managers can drill down from metrics into individual conversations, enabling early intervention before issues escalate.

User Journey – Urgent Customer Issue

This journey illustrates how the platform supports an urgent customer issue from initiation to resolution.

Steps

1. Customer initiates contact on WhatsApp
2. Conversation appears in the unified timeline with urgency indicators

3. Agent reviews context and responds using suggested assistance (Human Intervention)

4. Escalation is recommended and actioned

5. Manager gains visibility into the high-risk issue

The whole user/platform journey looks like:

- Agent dashboard → timeline → agent response → escalation
